

One Canadian woman (001092713), age unknown, experienced a near-death ordeal in a situation that critics of abortion pills previously predicted. Critics warned that allowing the abortion pill to be given to women without any medical supervision would inevitably result in a woman with an undiagnosed ectopic pregnancy using the pills – to her harm.

The makers of the abortion pill protocol strictly warn that the product is not to be used if there is suspicion of an ectopic pregnancy where the new life implants outside the womb. "Prior to prescribing Mifegymiso, health professionals must...exclude ectopic pregnancy," states the product literature. This happens typically by way of ultrasound. The possibility of an ectopic pregnancy must be excluded since the abortion pill cannot expel the new life growing outside the woman's womb in her fallopian tube.

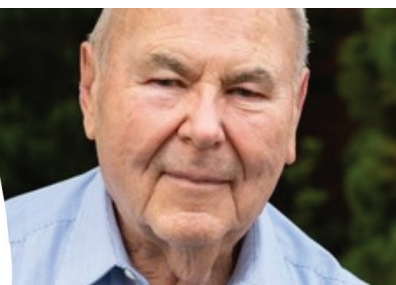

The new life growing in the tube eventually causes the tube to expand and rupture. The ruptured tube is deadly to the mother. The problem, as explained by the product literature, is that the woman with an ectopic pregnancy may mistake her ruptured tube for the effects of the abortion pills. "Some of the symptoms of a medical abortion may be similar to those of a ruptured ectopic pregnancy," the literature states.

The woman mentioned above experienced "Ruptured ectopic pregnancy" along with "pain" in a report that listed the outcome as "serious."

REST IN PEACE

ROBERT (BOB) RANN

In 2019, Health Canada recklessly put women's lives at risk by removing the ultrasound requirement to prescribe the drug.

The most recent data dump of women harmed by the abortion pill protocol is from March of this year. A total of 36 reports were submitted in that month. This is a huge spike when compared to previous years. In 2023, there were nine reports in total for the abortion protocol submitted (data retrieved for Mifegymiso and Mifepristone/Misoprostol). In 2022, 8. In 2021, 3. In 2020, 45. The 36 reports in 2024, when compared to the average number of reports since 2017 (which is 11), represent a staggering 227% increase.

The evidence is clear: Canadian women are being harmed by the chemical abortion protocol. The "Canada Vigilance Program" is working and showing that there is significant harm being caused to women to justify pulling this protocol from the market. One woman dead and over a hundred seriously injured is already far too many. And these numbers are likely only the tip of the iceberg, given that the adverse reaction program is voluntary and an unknown number of cases go unreported.

It's time to pull Mifegymiso and the Mifepristone/Misoprostol abortion protocol off the market. Canadian women's lives matter. How many more women will be seriously harmed and even killed before Health Canada acknowledges the data and decides to act?

Abortion activists like to refer to the abortion pill protocol as “medicine.” But medicine is meant to cure an illness or disease. Pregnancy is not a disease. The abortion pill protocol is, therefore, not medicine but deadly drugs that are intended to end the life of preborn humans. The protocol can sometimes be fatal to the mother, too.

Canada needs to return to valuing all human life. It must become a leader in human rights by banning drugs that are aimed at ending the lives of smaller and more vulnerable humans – namely, those who are preborn. It must ban drugs that are causing severe harm to mothers. Preborn children's lives are on the line. Mothers' lives are on the line. Health Canada must act to ban this drug.

THE HORRIFYING TRUTH BEHIND MAID THEY AREN'T TELLING YOU

By Camilla Gunnarson

In a recent Daily Wire episode, Dr. Jordan Peterson and Canadian veteran Kelsi Sheren discuss the horrible reality behind Medical Assistance in Dying (MAiD) services; specifically, how euthanasia drugs actually cause death.

My guess is most people haven't thought about how exactly drugs designed to kill a person actually work. They have come to believe that

MAiD is “compassionate healthcare” and a “painless and dignified” death, and they simply wish to end the suffering of their loved one. But Sheren wants everyone to know that nothing could be further from the truth.

She recently got a copy of the report presented to Senate Committee on Legal and Constitutional Affairs hearings in 2021 and discovered through Freedom of Information reports and expert testimony, that death by MAiD is similar to death by drowning.

Sheren explains that she learned that in order to euthanize a person, four drugs are utilized. The first drug administered is sodium thiopental which is an anesthetic causing paralyzation of the patient, which typically takes about 15 minutes to take effect. The subsequent drugs

result in death by pulmonary edema, a condition in which fluid builds up in the lungs (similar to drowning), which can take a patient up-to 24 hours to die.

Within the Senate Committee report, research from Dr. Zivot, a Canadian and associate professor of anesthesiology and critical care at Emory University in Atlanta Georgia, presented his research on studying the autopsies of over 300 criminals in the United States who were executed by lethal injection. He said that assisted death *"could be exceedingly painful and more like akin to drowning...The death penalty is not the same as assisted dying, of course. Executions are meant to be punishment; euthanasia is about relief from suffering. Yet for both euthanasia and executions, paralytic drugs are used. These*

drugs, given in high enough doses, mean that a patient cannot move a muscle, cannot express any outward or visible sign of pain. But that doesn't mean that he or she is free from suffering...."

Sheren noted that Zivot's research found that in 85 per cent of the execution cases, "the lungs were twice their normal weight and full of water." She further explained that when this drug is pushed, it causes a drowning and it [Zivot's report] stated that it is "akin to dying by waterboarding or drowning."

Sheren believes that "the reason people in Canada who are given MAiD seem peaceful is because they are being given a paralytic first...That person could be literally screaming if they weren't under a paralytic."

The reason people in Canada who are given MAiD seem peaceful is because they are being given a paralytic first...That person could be literally screaming if they weren't under a paralytic.

The Euthanasia Prevention Coalition who has been educating the public on issues related to euthanasia and assisted suicide for decades first warned the public about the inhumane methods used to kill patients since 2018, but perhaps Peterson's and Speren's influence, will allow the public to finally take notice of just how horrific MAiD is. Please share this hard truth with your loved ones.

OVER 100 CANADIAN WOMEN SERIOUSLY HARMED BY ABORTION PILL, ONE DEAD

By Pete Baklinski, Director of Communications, Campaign Life Coalition

Canadian abortion activists have hailed the abortion pill as the "gold standard" method for ending the life of a preborn child, highlighting its allegedly "outstanding safety record." But, according to the Canadian government's website that tracks adverse reactions to drugs, over 100 Canadian women have been severely harmed by the abortion pill protocol since it first became available in Canada in 2017.

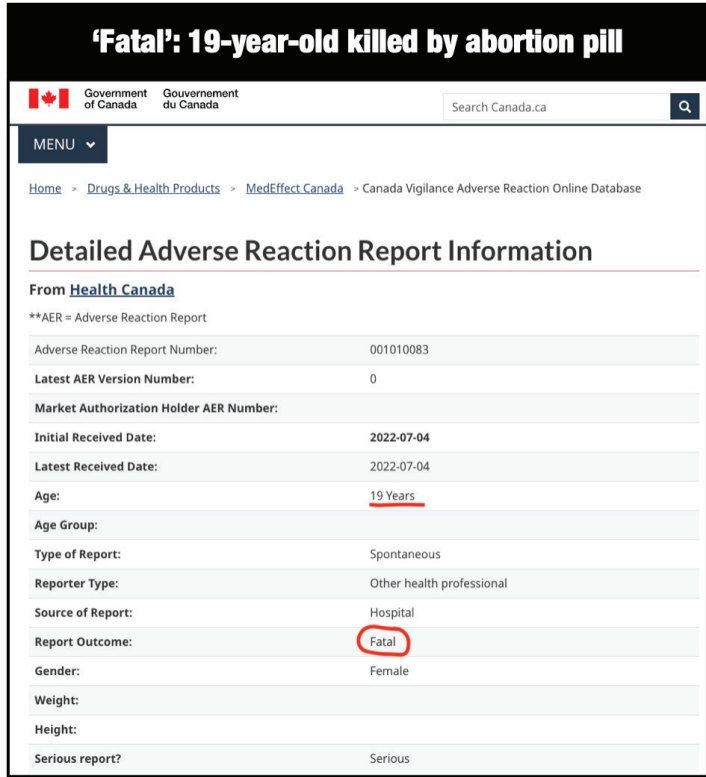

One 19-year-old, along with her baby, tragically died in the wake of using the deadly pills, according to Canada's adverse reaction online database.

but not until it had already caused malformations in some 100 babies.

The abortion pill protocol is marketed in Canada as "Mifegymiso." It consists of two drugs taken at different times. The pregnant mother first takes Mifepristone orally in the form of a pill. This drug blocks the mother's progesterone, a hormone needed to sustain the tiny new life attached to her uterine wall. Without progesterone, the mother's pregnancy-sustaining mechanism shuts down. The new life is ended. Some 24-48 hours later, the woman orally ingests the second drug. Misoprostol initiates powerful uterine contractions that cause the woman to bleed heavily as she expels her dead baby.

As of July 2024, there have been over 100 adverse reports for the abortion pill protocol. Fifty-one are listed for the protocol branded as "Mifegymiso." An additional 67 are listed when a search is performed for the two drugs that comprise the Mifegymiso protocol – Mifepristone and Misoprostol.

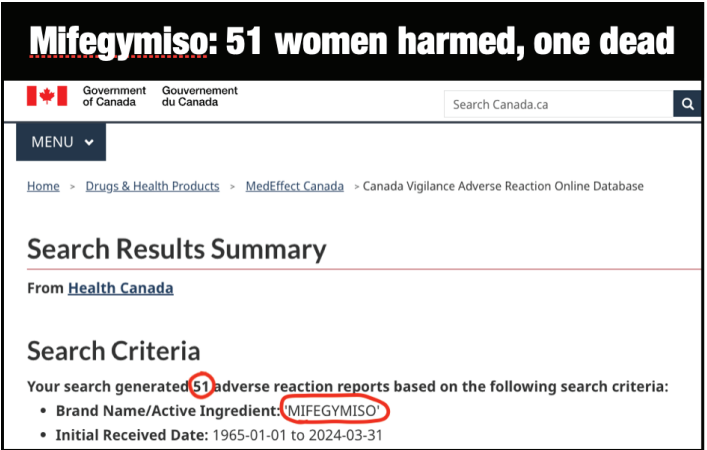

'Fatal': 19-year-old killed by abortion pill

The "Canada Vigilance Program" is used by the government's Department of Health to track adverse reactions, or side effects, to drugs and other health products used by Canadians. Healthcare professionals, such as doctors, voluntarily submit reports if they suspect that a drug has seriously harmed their patients.

Programs such as these act as an early warning system, allowing the government to pull a drug from the market before it harms more people. One of the most well-known recalls was Thalidomide, a German-made drug widely used in the 1950s-60s to treat nausea in pregnant women. The drug, marketed in Canada as "Kevadon," had the devastating side effect of causing severe birth defects in children in utero. The Canadian government recalled the drug in 1962,

Mifegymiso: 51 women harmed, one dead

These women have suffered "serious" outcomes after using abortion pills, one dying and numerous others having near brushes with death. Adverse reactions include many side effects listed in Health Canada's product literature for Mifegymiso. The vast majority of cases are categorized as "serious," meaning that the abortion pills' effects on the women were life-threatening, and/or required hospitalization, and/or resulted in disability or permanent damage.

According to the data, Canadian women using the abortion pill protocol have experienced hemorrhaging (severe blood loss at times requiring transfusion), loss of consciousness, sepsis (the body's extreme response to an infection that damages vital organs), septic shock resulting in death, and thrombosis (blood clots in the circulatory system), to name a few.
